gmapping

[indigo](#)[kinetic](#)[lunar](#)[Show EOL distros:](#) ☐[Documentation Status](#)[slam_gmapping](#): [gmapping](#) | [openslam_gmapping](#)

Package Summary

[✓ Released](#)[✓ Continuous Integration](#)[✓ Documented](#)

This package contains a ROS wrapper for OpenSlam's Gmapping. The gmapping package provides laser-based SLAM (Simultaneous Localization and Mapping), as a ROS node called slam_gmapping. Using slam_gmapping, you can create a 2-D occupancy grid map (like a building floorplan) from laser and pose data collected by a mobile robot.

map_server

[indigo](#)[kinetic](#)[lunar](#)[melodic](#)[Show EOL distros:](#) ☐[Documentation Status](#)

navigation: [amcl](#) | [base_local_planner](#) | [carrot_planner](#) | [clear_costmap_recovery](#) | [costmap_fake_localization](#) | [global_planner](#) | [map_server](#) | [move_base](#) | [move_base_msgs](#) | [move_slowly](#) | [robot_pose_ekf](#) | [rotate_recovery](#) | [voxel_grid](#)

Package Summary

[✓ Released](#)[✓ Documented](#)

map_server provides the map_server ROS [Node](#), which offers map data as a ROS [Service](#). It also provides the map_saver command-line utility, which allows dynamically generated maps to be saved to file.

2. Command-line Tools

2.1 map_server

`map_server` is a ROS node that reads a map from disk and offers it via a ROS service.

The current implementation of the `map_server` converts color values in the map image data into ternary occupancy values: free (0), occupied (100), and unknown (-1). Future versions of this tool may use the values between 0 and 100 to communicate finer gradations of occupancy.

2.1.1 Usage

```
map_server <map.yaml>
```

2.1.2 Example

```
roslaunch map_server map_server mymap.yaml
```

```
turtlebot3_world.launch http://loca
ailable.

AMCL 定位

AMCL蒙地卡羅定位升級版

$t = 0$

The algorithm initializes with a uniform distribution of particles. The robot considers itself equally likely to be at any point in space along the corridor, even though it is physically at the first door.

Sensor update: the robot detects a door. It assigns a weight to each of the particles. The particles which are likely to give this sensor reading receive a higher weight.

Resampling: the robot generates a set of new particles, with most of them generated around the previous particles with more weight. It now believes it is at one of the three doors.

$t = 1$

Motion update: the robot moves some distance to the right. All particles also move right, and some noise is applied. The robot is physically between the second and third doors.

Sensor update: the robot detects no door. It assigns a weight to each of the particles. The particles likely to give this sensor reading receive a higher weight.

Resampling: the robot generates a set of new particles, with most of them generated around the previous particles with more weight. It now believes it is at one of two locations.

$t = 2$

Motion update: the robot moves some distance to the left. All particles also move left, and some noise is applied. The robot is physically at the second door.

Sensor update: the robot detects a door. It assigns a weight to each of the particles. The particles likely to give this sensor reading receive a higher weight.

Resampling: the robot generates a set of new particles, with most of them generated around the previous particles with more weight. The robot has successfully localized itself.

作業1

- 透過map_server 建立地圖，並上傳相關檔案
- 參考3/14上課內容，"ROS-Class-3.pdf"
- 加分部分
- 1. 3/28 前上傳(提早上傳加分)
- 2. 地圖存檔時用學號當檔名，如U123456.pgm與U123456.yaml
- 3. 紀錄實驗過程於word檔，紀錄所下的命令與回應，可多利用截圖(圖文並茂加分)
- 上傳作業包含:
- 1. U123456.pgm(檔名用學號)
- 2. U123456.yaml(檔名用學號)
- 3. 實驗紀錄word檔
